# Apparel customizer – user guide

Version 0.2.0 · Printtex

## Requirements

- PrestaShop 8.0 to 9.x
- PHP 7.4 or later, with the cURL extension
- A merchant space on the Printtex Personnalisation service (14-day free trial, then a monthly subscription to the service)

## What it does

Your customers place a logo, a photo or a text on the real garment, front and back, inside the print areas you set (left chest, centered, upper back…). They choose color, size and quantity, then the design goes into your PrestaShop cart as a customization of the product line, at the price of your price table. Your checkout, carriers and payment methods stay yours. In the order admin you get the preview, a 300 dpi PNG print file per print area and the placement note.

## Installation

1. In your back office, go to Modules > Module Manager > Upload a module and select `printtexperso.zip`.
2. Click Install, then Configure.

## Configuration

1. In your merchant space on the service, add your product: photos, print areas and prices.
2. In the module configuration, paste your Shop ID and your module key (both shown on the dashboard of your merchant space), then save.
3. Open each product to customize, Modules tab: enter the product ID from your merchant space and save the product. Leave it empty to disable customization on that product.

## Using it

- On the product page, a "Customize" button opens the customizer.
- When the customer confirms, the module reads the lines and their prices from the service (server to server, with your secret key) and adds them to the cart. The price never comes from the browser.
- Combinations: the line uses the default combination; color and size chosen in the customizer are written in the customization.
- Specific prices set on the product in PrestaShop also apply to the design.
- The cart currency must match the currency of your merchant space.

## Orders

In the order admin, each customization lists the design details, the preview, the print file per area and the placement note (copy the addresses to download the files). The customer only sees their choices.

## Data and privacy

The customizer script is loaded from the service on customized product pages only. The customer's design (images, texts, options) is sent to the service when they confirm. When an order is paid, the module sends the order number and the design references to the service, for the per-order commission described in the service terms. The module stores the product mapping and the design details in two tables of its own. Uninstalling removes the settings and keeps these tables so that past orders still show their designs.

## FAQ

**Do I need combinations?** No, a simple product is enough.

**The button does not appear.** Check the Shop ID in the configuration and the product ID in the Modules tab of the product.

**"Currency" error when adding to cart.** Your shop currency differs from your merchant space currency.

## Support

Through the PrestaShop Addons messaging of this module.
